FLOATING POINT DRIFT

Micro-variations in CPU floating-point calculations destroy cross-platform reproducibility.

CONTINUOUS MATH
TO BOUNDED
DETERMINISTIC
INTEGERS

SCALED INTEGER SPACE

The result: A verifiable execution contract that runs identically everywhere.

By multiplying all thresholds and continuous values by 10,000, OPHI converts chaotic floating-point math into a rigid, deterministic integer space.

THE CODE-TO-CANVAS EXECUTION CONTRACT

No intermediate interpretation layers. The pipeline maps strict deterministic intent directly to the RGB state-space.

The Omega equation governs the state space trajectory

TIME.STAMP: 2024.10.27.10.10.09.UTC

LATENCY: 0.000ms

THROUGHPUT: 10²¹ OPS

ENTROPY.LEVEL: 0.0001%

VERIFICATION.STATUS: CONFIRMED

state: Current system value
(e.g., initial 0.612).

α (alpha): Chaotic multiplier for
continuous evolution (e.g., 1.001).

$$\Omega = (\text{state} + \text{bias}) \times \alpha \times \text{reliability} \times \text{grounding}$$

bias: Offset/drift control
(e.g., -0.002).

reliability: Systemic dampener
controlling visual sprawl.

grounding: Anchor factor preventing
total mathematical divergence.

- The Ω operator acts as the reproducible trajectory constructor.
- Continuous variables are processed, but their output is rigorously snapped to the scaled integer grid.

OPHI.VER: v3.24.29 ~ ?

Only thermodynamically stable states become fossilized

The SE44 thermodynamic gate determines transition admissibility. States failing these bounds are stripped from the rendering history.

The system bifurcates discarded noise from immutable history

The wave function is mapped as a bounded state vector. Rejection preserves the purity of the visual output.

	Mutable Shell (Rejected States)	Merkle Ledger (Accepted Fossils)
Storage	Discarded to transient shell JSON	Preserved in immutable JSON ledger
Visual Role	Isolated to prevent visual noise	Cryptographically locked to the aesthetic history
Mathematical Integrity	Preserves the core aesthetic manifold by its absence	Tied directly to the verified mathematical history
Truth Binding	Unlinked	Linked via SHA-256 blocks with a verified tree root

Truth binding ensures execution history cannot be altered

- Instead of allowing predictions to remain fluid across temperature settings, each accepted state is committed as an indexed fossil.
- Altering a single historical transition breaks the hash chain, immediately invalidating the visual render.

A closed symbolic grammar maps intent deterministic glyphstreams

The OPHI ISA consists of 64 triad codons. This biological framing is a high-efficiency compression scheme, making a formal virtual machine intuitive without sacrificing precision.

The 64-instruction architecture spans four biosemantic domains

Every codon in the triadic lattice possesses explicit operational semantics, mapping semantic intent to the state vector.

A-Series

Foundation & Memory (Adenine-Rooted)

Focuses on temporal logic and state anchoring.

T-Series

Termination & Protection (Thymine-Rooted)

Governs endings, protections, and collapse suppression.

C-Series

Structure & Integrity (Cytosine-Rooted)

Architectural integrity and permanent preservation (fossilization).

G-Series

Amplification & Evolution (Guanine-Rooted)

Facilitates growth, trigger drifts, and runaway evolution.

Systemic DNA embeds translated metadata into the state space

Metadata is not stored externally; it is encoded as semantic glyphstreams woven directly into the architecture of the state space.

Codon	Glyph	Name	Delta-Type	Stack Effect
ATG	⌂⌂	Genesis / Bootstrap	δ_{all}	$[\emptyset] \rightarrow [seed]$
CCC	△△	Integrity Lock (Fossil)	δ_{all}	$[volatile] \rightarrow [eternal]$
TAA	⌂⬢	Termination Glyph	δ_{state}	$[running] \rightarrow [\emptyset]$
CTT	□▷▷	Echo Resonance	δ_{bias}	$[pulse] \rightarrow [wave]$
GAC	◼△	Controlled Decay	δ_{bias}	$[abrupt] \rightarrow [gradual]$

The ledger generates four strictly deterministic visualization canvases

OPHI is not a random image generator. It is a rigid visual ledger where every pixel traces back to a signed state transition.

Tracks Ω evolution step-by-step.

Maps $z[n]$ vs $z[n+1]$, revealing hidden geometries.

Maps spatial weight in thermal probability buckets.

The full-color multidimensional synthesis.

Infinite expression emerges from absolute mathematical provenance

```
--initial 0.612  
--bias -0.002  
--alpha 1.001
```

```
--initial 0.613  
--bias -0.002  
--alpha 1.001
```

```
--initial 0.612  
--bias -0.001  
--alpha 1.001
```

Deterministic chaos. Altering a single initial parameter by 0.001 yields a wholly new visual manifold.

Yet, every variant remains cryptographically locked, perfectly reproducible, and undeniably sound.

Proof-carrying computation extends far beyond generative art

OPHI STATE SPACE VERIFICATION REPORT

LEDGER_VALID: **true**

HASH_CHAIN_VALID: **true**

FINAL_FOSSIL_HASH_SHA256: a8d83f1d0ec1582b...

A formal VM disguised
as conceptual art.

The underlying architecture is a novel contribution that solves real reproducibility crises. With minimal modification, OPHI's proof-carrying computation could revolutionize verified ML initialization and reproducible scientific simulation.
